## Are you Lucky or Good?

During the mid 80s, the industrial community started to understand that a good process safety performance is *conditio sine qua non* to ensure long-term continuity of businesses; not to speak about safety of employees, public, environment and assets. The landscape of process safety has proven complex, with many dimensions to consider, including both technical and cultural / organisational elements. The analogue of a GPS navigator is clearly needed to pinpoint the current position of an organisation, and to provide a roadmap towards improvement.

### Aspects to be discussed in an interactive setting

- How to assess process safety performance.
- Cultural/organisational and technical elements.
- Process safety management for non-chemical industries.
- What the future will bring: data analytics.
- Lessons learned in real case studies.
